SURGICAL DISCHARGE INSTRUCTIONS FOR FELINE NEUTER

DATE: _____	DOCTOR: <input type="checkbox"/> Tejinder Sodhi
PATIENT: _____ Gender : _____	<input type="checkbox"/> Raja Velu
	<input type="checkbox"/> _____

Your cat is recovering from major surgery, which requires continued nursing care at home in order to ensure a successful outcome. Your job during the recovery period at home is just as important as the procedure we just completed. When your pet is discharged, he may be groggy from the anesthesia. He may appear depressed, wobbly and may tremble. He should be allowed to recover in a quiet room at home away from other pets. Check on his progress intermittently. First offer only small amounts of water, and if he seems alert and hungry, offer small amounts of food (~1/3 of usual meal). Every pet reacts differently; some pets may not want anything at all the first night. If your pet vomits, withhold food until the next morning. Call our office immediately if vomiting persists. By the next morning, he should be alert and have a normal appetite and can then be fed his normal volume of food. If we prescribed pain medication for your cat, administer it as directed to make him more comfortable. Care at home mainly entails **restriction of activity** for a few days because your cat does not understand the significance of the recovery period. He will become very active in a short period of time, and confinement indoors by you is of the utmost importance! This entails:

No jumping or running No stair climbing No playing with other pets No "rough housing"

If your cat is to be left alone, he must be confined to a cage or other small area such as a child's playpen or a shower stall. This strict confinement must be continued during the entire convalescent period. Excessive activity often leads to injury or serious complications that result in infection at the surgical site. This means additional expense to you and added discomfort to your cat.

Do not bathe your cat during the first 10 days of recovery. Observe the scrotum daily for signs of redness, swelling, or discharge. Please call us if any of these symptoms are evident. We also have various sizes of protective collars to keep your cat from licking at the surgical site. Licking can lead to inflammation or infection, which may require hospitalization. In general, your cat should improve gradually each day. If his condition suddenly worsens please call our office as soon as possible.

- ★ Please do replace your cat's regular litter with shredded newspaper at least for next 3-4 days.
- ★ Do not allow your cat to go outdoor if possible.
- ★ There is no stitches to be removed in cat neuter surgery unless/otherwise notified by doctor/technician or staff member.

If you have questions or concerns during your pet's recovery, please do not hesitate to call our office at (425) 771-6300.

If you need advice after hours, please call the emergency clinics following the list below	
VCA Veterinary Specialty Center of Seattle	(425) 697-6106
ACCES-Animal Critical Care & Emergency Clinic	(206) 364-1660
Animal Medical Center of Seattle	(206) 204-3366
